

Accessing Peer-Reviewed Journal Articles

Step 1: Search for UNK library in a search engine (such as Google).

Step 2: Click on the link for A-Z Databases.

Step 3: Locate journal of interest. If you want to use PubMed, you can jump to all “P” articles.

[Library Hours](#)

Featured Databases

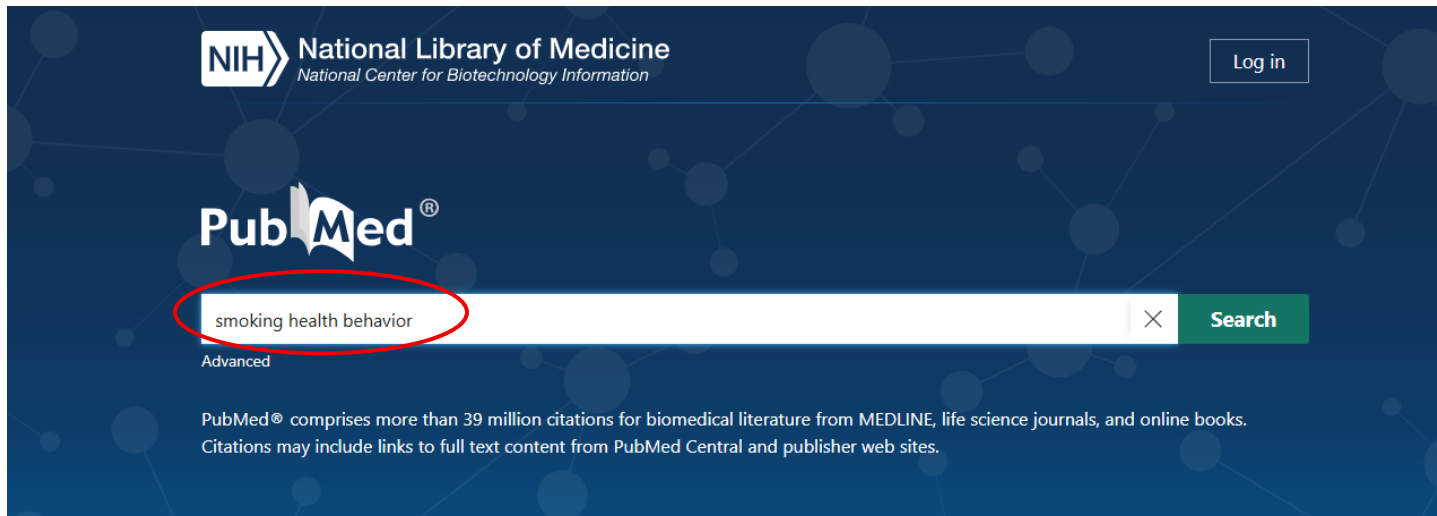

Step 4: Select the journal of your choice. For this class, good options include PsycARTICLES, Psychology & Behavioral Sciences Collection, PsycInfo, and PubMed. I will use PubMed for this example.

- [PsycARTICLES](#)

Scholarly articles related to psychology from 1894 to the present. Includes more than 160,000 full-text articles from 80+ journals published by American Psychological Association and allied organizations. All journals included in this database are also indexed within PsycINFO.
- [Psychology & Behavioral Sciences Collection](#)

Access to more than 500 full-text journals related to psychology, psychiatry, and related disciplines.
- [PsycINFO](#)
Alternate Name(s): APA PsycInfo
Contains citations and abstracts to articles in journals, dissertations, and book chapters in all areas of psychology. Includes all articles from the PsycARTICLES database.
- [PTSD Pubs](#)
Alternate Name(s): Formerly named "PILOTS Database - Literature on Traumatic Stress"
Indexes the literature on traumatic stress and its consequences.
- [PubChem](#)
PubChem is an open-access resource providing information on the biological activities of small molecules.
- [PubMed](#)
PubMed is a service of the U.S. National Library of Medicine that includes over 18 million citations from MEDLINE and other life science journals for biomedical articles back to 1948.

Step 5: Search key words for your topic in the journal's search engine.

Step 6: Start filtering article results. To make sure you have access, I would suggest limiting to “free full text” (may have similar names in other journals, such as “PDF included”, “Full text available”, etc.). You may also need options from additional filters (e.g., set language to English, etc.).

Abstract:

E-cigarettes are electronic nicotine delivery systems (ENDS) which mimic tobacco smoking without the combustion of tobacco. These devices have been misleadingly marketed as "less harmful" alternatives to conventional smoking tobacco products. The e-liquid in e-cigarettes include nicotine, a humectant and other additives including flavourings, colourants, or adulterants such as bacterial and fungal products. In this review, we discuss the contrasting views of the tobacco lobby and most professional societies. We describe the epidemiology of the use of these devices, with a widespread and significant rise in youth e-cigarette use seen in both the USA and Europe. We also describe what is known about the toxicity and mechanisms of EVALI (e-cigarette or vaping associated lung injury). This characterised by respiratory failure with an intense inflammatory response. The presentations are diverse and clinicians should consider vaping as a possible cause of any unusual respiratory illness in patients who have a history of vaping or other use of e-cigarette-related products. Second hand exposure to e-cigarettes is also harmful through respiration and transdermal absorption. E-cigarettes have a worse acute toxicity than tobacco and their long-term toxicity is unknown, and we advocate for the immediate, most vigorous anti-vaping legislation possible.

Pro-tip: It would be a good idea to keep a working document to stockpile important information on each article, such as the APA citation (see next step) and a few notes about the topic. This will make your life much easier when you need to go back and find something in an article.

Step 9: Generate APA citation in the citation machine. Make sure the citation style is set to APA. Note- these are not always perfect, so make sure the information is correct (like here, where the journal title should be in title case, but is all lowercase instead).

Educational Aims

The reader will come to:

- Understand that e-cigarettes have been misleadingly marketed as “less harmful” alternatives to conventional cigarettes.
- Be aware that there is a rising incidence in e-cigarette use in young people worldwide.
- Recognise that e-cigarettes have a greater acute toxicity than tobacco (EVALI, e-cigarette or vaping associated lung injury) which leads to respiratory failure with an intense inflammatory response; and hence it is nonsense to assert that long term they are less toxic than tobacco
- Realise that second hand exposure to e-cigarettes is a health concern for bystanders.
- Be aware of the urgent need for stringent anti-vaping legislation.

BACKGROUND

E-cigarettes are electronic devices which belong to an enlarging number of electronic nicotine delivery systems (ENDS) that mimic tobacco smoking without combustion of tobacco [1]. These devices

have been marketed as “safer” alternatives to conventional smoking tobacco products (CSTP) to:

- a. help established smokers quit any form of tobacco usage, or
- b. change to a ‘safer’ alternative form of “smoking experience” (in reality, nicotine addiction), or
- c. prevent non-smokers from starting to smoke, while satisfying a craving for nicotine and providing other, less tangible benefits associated with the act of smoking [2].
